[http://cf.linnbenton.edu/eit/auto/krolicp/upload/Compression\\_Vacuum.pdf](http://cf.linnbenton.edu/eit/auto/krolicp/upload/Compression_Vacuum.pdf)

- 1) Why is it easier to use a vacuum gauge than a compression gauge?
  
  
  
  
  
  
  
  
  
  
- 2) A relative compression test using a lab scope can find a cylinder with low compression. Why is a relative compression not a good test to find if low compression is the cause for a non-starting engine?
  
  
  
  
  
  
  
  
  
  
- 3) How much cranking vacuum will indicate an engine has enough compression to run?
  
  
  
  
  
  
  
  
  
  
- 4) What creates manifold vacuum?
  
  
  
  
  
  
  
  
  
  
- 5) How can you tell if a vacuum line is attached to manifold vacuum instead of ported vacuum?  
(assume the engine does run)
  
  
  
  
  
  
  
  
  
  
- 6) Why is a larger vacuum gauge superior to a smaller vacuum gauge?
  
  
  
  
  
  
  
  
  
  
- 7) How is vacuum related to pressure? How can you convert " Hg to PSI?

- 8) What type of sensor is used to signal manifold vacuum/pressure to the PCM?
- 9) How will the position of the throttle (which is connected to the gas pedal) affect manifold vacuum?
- 10) Why is cranking vacuum much lower than the vacuum on a running engine?
- 11) What engine operating condition will cause manifold vacuum to go to it's highest level?
- 12) On a running engine, when will manifold vacuum to drop to it's lowest level?
- 13) On a running engine, low compression will show up on a vacuum gauge.  
How can you tell if the low compression is due to a defect in only one cylinder?
- 14) Why will a restricted exhaust cause manifold vacuum to be low?
- 15) What are some common causes for leaks in the air intake system?
- 16) How can you become confident at using the vacuum gauge as a diagnostic tool?

- 17) What is considered the maximum safe RPM for running an engine that is in neutral?
- 18) How can you safely observe manifold vacuum while the throttle is wide open?
- 19) What can cause an engine with perfect compression to have no cranking manifold vacuum?
- 20) How can you quickly tell if an engine with no cranking vacuum has compression?
